

RB4000 Series Regulator

Commercial & Industrial Regulator

Applications

The RB4000 regulator is designed for gas supply networks, district station regulation, industrial service regulation, and all applications where accurate pressure control, ease of adjustment, and fast response are required such as for burners, industrial ovens, boilers, etc.

Description

The RB4000 employs a direct-acting, spring-loaded regulator. The balanced valve design ensures a constant outlet pressure when the upstream pressure varies. A built-in pulsation damper allows stable pressure control even at very low flow rates. An optional built-in shut-off valve offers protection against over-pressure or under-pressure.

Benefits

- > Accurate regulation
- > High flow accuracy
- > Fast response for sharp on-off loads
- > Easy maintenance
- > Compact size
- > Rugged construction for durability
- > Balanced valve design eliminates inlet pressure effect
- > Wide range of outlet pressures
- > Horizontal or Vertical mounting

Features

- > Interchangeable adjustment spring
- > Balanced valve design
- > Downstream control
- > Direct acting spring loaded design
- > Over pressure shut-off (OPCO) available
- > Under pressure shut-off (UPCO) available
- > Built-in silencer available
- > Monitor version available

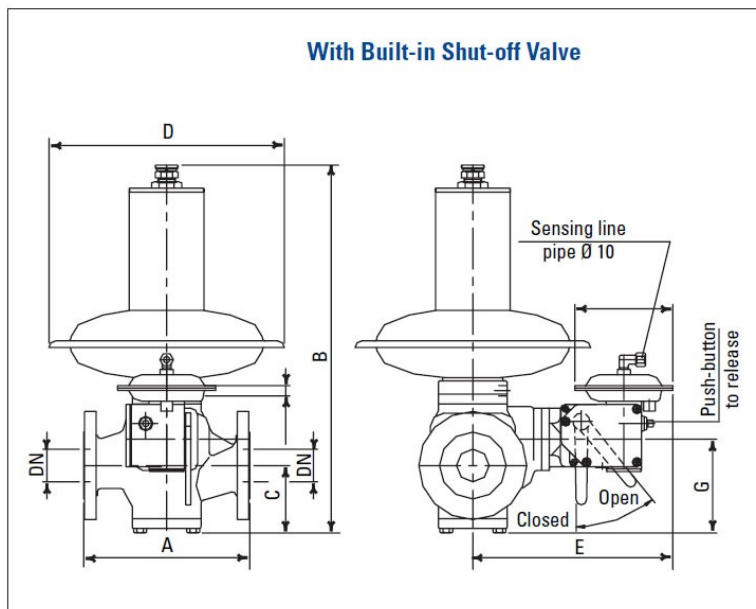

Shipping weight:

1 regulator per box Box weight: 121 lbs.

3"	3"	X	3"	8540

Correction factors for non-natural gas applications

The RB4000 may be used to control gases other than natural gas. To determine the capacity for gases other than natural gas, multiply the values within the capacity tables by a correction factor. The table below lists the correction factors for some of the more common gases:

Gas Type	Specific Gravity	Correction Factor (CF)
Air	1.00	0.77
Butane	2.01	0.55
Carbon Dioxide (Dry)	1.52	0.63
Carbon Monoxide (Dry)	0.97	0.79
Natural Gas	0.60	1.00
Nitrogen	0.97	0.79
Propane	1.53	0.63
Propane-Air-Mix	1.20	0.71

To calculate the correction factor for gases not listed in the table above, use the gases' specific gravity and insert it in the formula listed below:

$$\text{Correction Factor (CF)} = \sqrt{\frac{SG_1}{SG_2}}$$

Where:

SG₁ = Specific gravity of the gas in which the capacity is published.

SG₂ = Specific gravity of the gas to be controlled.

Wide Open Flow Calculations

For wide-open orifice flow calculations use the following equations:

$$\text{For } P_1/P_2 < 1.89 \text{ use: } Q = K \sqrt{P_2(P_1 - P_2)} \quad \text{For } P_1/P_2 > 1.89 \text{ use: } Q = \frac{KP_1}{2}$$

Where:

P₁ = Absolute Inlet Pressure (PSIA)

P₂ = Absolute Outlet Pressure (PSIA)

Q = Flow Rate (SCFH)

K = Orifice Coefficient (SCFH/PSI)

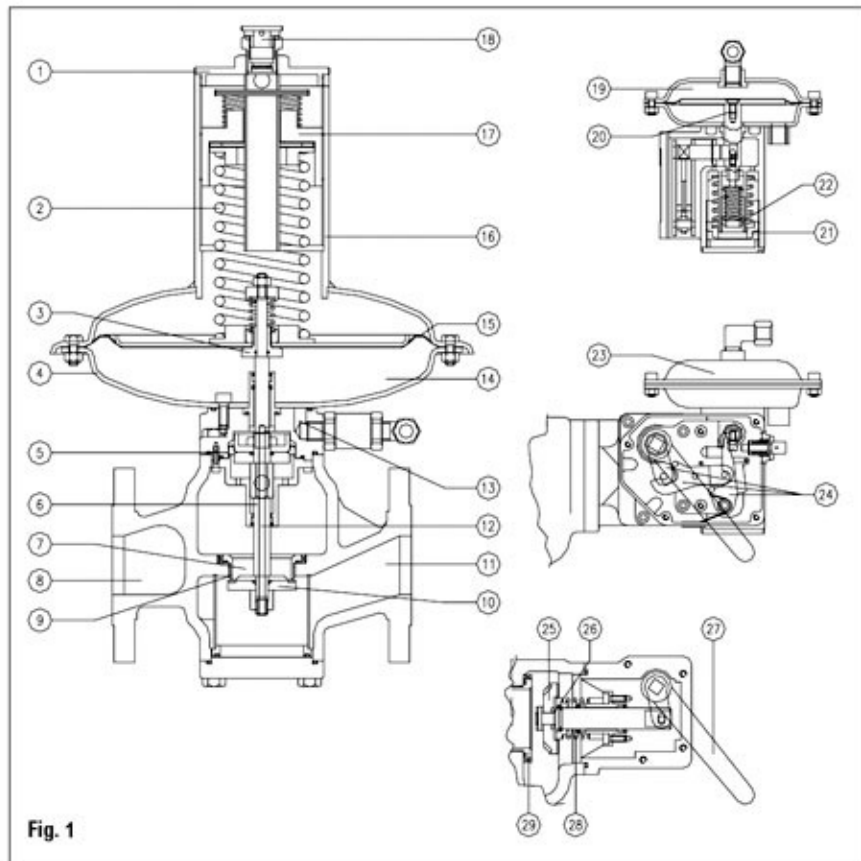

Fig. 1

Principle of Operation

A. Normal operation. The internal monitor IM orifice performs like a standard regulator and monitor regulator in that main orifice and valve seat actuate to control outlet flow and pressure under normal flow conditions. If there is no demand, the main seat and internal monitor orifice will close.

B. Monitor operation. If the main valve seat fails to control the gas flow and pressure due to foreign matter between the seat and orifice face, or if the seat is eroded, the internal monitor orifice automatically goes into operating position at a slightly higher outlet pressure (see Internal Monitor Lock-up Pressure table). Any time the pressure on the main diaphragm exceeds the force of the fixed monitor spring, the increased outlet pressure causes the main valve seat to push against the sliding orifice. The sliding orifice compresses the monitor spring and positions the monitor orifice to control the gas flow. The IM orifice now functions as a monitor regulator and continues to monitor as long as the main seat fails to control at the normal adjusted outlet pressure. If the gas load demand is increased beyond the internal monitor's capacity, the outlet pressure is reduced to normal adjusted pressure and the regulator resumes normal regulation.

C. Monitor lock-up. If the demand for gas is decreased to zero flow during monitor operation, the sliding orifice continues to close until its orifice is in the gas tight position (monitor lock-up) against the BUNA-N monitor valve seat. (See the Internal Monitor Lock-up Pressure table for the outlet pressure required for internal monitor lock-up.)

D. Vent hole V option. On installations where a small volume of over-pressure gas can be safely vented to the atmosphere, the advantages of both the pilot relief valve and monitor safety can be combined. If the flow is decreased to zero or just greater than zero, the vent hole in the internal monitor orifice allows gas to slowly bleed downstream and cause the pressure to rise to the relief point of the pilot's internal relief valve. The gas then bleeds to the atmosphere indicating a problem with the regulator.

Vent Lines for Regulators

When constructing vent lines to be attached to regulators installed indoors, follow a few basic rules:

- Never use pipe sizes smaller than the vent size; smaller pipe sizes restrict the gas flow. If a long gas run must be used, Itron advises increasing the pipe one nominal size every ten feet to keep the flow restriction as low as possible.
- Keep the vent line length as short as possible to minimize the restriction and reduce the vent's tendency to cause regulator pulsation.
- Support the vent pipe to eliminate strain on the regulator diaphragm case.
- Always point outdoor vent pipes in the downward position to reduce the possibility of rain, snow, sleet, and other moisture entering the pipe. Install a bug screen in the end of the pipe.
- Do not locate the vent line terminus near windows, fans, or other ventilation equipment. See the installation instructions furnished with the regulator.
- Adhere to all applicable codes and regulations.
- If your vent pipe causes regulator pulsation, consult your sales representative or manufacturer.
- Itron strongly recommends running a separate vent line for each regulator. Headers with various installed devices can cause regulator malfunction.

Caution Ensure the end of the vent line is away from ANY potential ignition sources. It is the installer's responsibility to ensure the vent line is exhausting to a safe environment.

Installation

Warning Itron does not endorse or warrant the completeness or accuracy of any third party regulator installation procedures or practices, unless otherwise provided in writing by Itron. Follow your company's standard operating procedures regarding the use of personal protection equipment (PPE). Adhere to guidelines issued by your company in addition to those given in this document when installing regulators.

Fig. 4

Start-up Procedure

After the pressure regulator has been installed, make sure that:

- The on/off valve upstream and downstream and the discharge vent pipe are all closed
- The pressure of the inlet gas is not higher than the established design value

After these checks have been made, proceed as follows:

- Partially open the upstream on/off valve slowly just enough to make sure that a very small amount of gas passes.
- Reset the shutoff valve whenever it has been set for minimum pressure intervention because it will be closed in the absence of pressure (see the paragraph regarding the resetting of the shutoff unit).
- Check that the pressure rises slowly on the upstream and downstream pressure gauge's; the downstream pressure must stabilize around the pre-set set value or a value slightly higher (if the pressure continues to rise, interrupt the starting procedure by closing the upstream on/off valve and consult the trouble-shooting diagram to identify the cause of the malfunction).
- After the upstream pressure value has stabilized, open the upstream on/off valve completely.
- Slowly open the downstream on/off valve until the piping is completely filled.

At this point, the pressure regulator is operative. The same procedure must be used when installing monitor-equipped pressure regulators connected on line with the active pressure regulator (see Fig. 2), bearing in mind that the pressure gauge installed in the section in between the two regulators must indicate the same pressure value as the upstream gauge.

Pressure Regulator Setting (See the Principle of Operation Schematic)

The pressure regulator is usually delivered already set to the specifications indicated in the order. Whenever the set pressure must be

modified, this value must be set within the setting range of the spring installed.

After first checking the suitability of the spring installed to achieve the desired setting value, proceed as follows:

- To increase the value of the set pressure: rotate the spring adjustment ferrule (lock) nut clockwise using the adjustment wrench until the desired value is reached (which can be read on the gauge downstream).
- To decrease the value of the set pressure: proceed as above, rotating the spring adjustment ferrule counter-clockwise.
- These operations can be performed regardless of whether the pressure regulator is delivering flow or the downstream on/off cock is closed, making sure (in the latter case) to open the discharge plug (control line intake), downstream of the regulator. This valve should be closed after the desired set pressure is obtained.

Shutoff Device Setting

After first checking the suitability of the spring installed to achieve the desired set pressure, proceed as follows:

- Check the setting of the shut off unit
- To reach the maximum downstream pressure:
- Close the ON/OFF valve downstream (Fig.1) and slowly increase the pressure downstream until the desired maximum intervention pressure is reached.
- To correct this value, rotate the overpressure adjustment spring nut clockwise to increase the set pressure and counter-clockwise to decrease the value. (See the Principle of Operation Schematic)

To reach the minimum downstream pressure:

- Close the upstream ON/OFF valve (Fig. 1), and slowly discharge the downstream pressure until the desired minimum intervention pressure is reached.
- In order to correct this value rotate the under pressure adjustment spring nut (See Principle of

Operation Schematic) clockwise to increase the setting value, and counter-clockwise to decrease the value.

IMPORTANT!

The changing of the setting of the shutoff valve must always be performed with the shutoff valve diaphragm chamber under pressure. (See the Principle of Operation Schematic)

Shutoff Device Reset (Fig.1, 2 & 3)

The shutoff device must be reset only after first identifying the reason why it triggered in the first place. To restore normal operating conditions the following operations should be performed.

- Close the ON/OFF valve downstream;
- Open the valve for the upstream and downstream pressure gauges
- Downstream pressure = 0 (discharge any residual pressure by opening the discharge vent pipe).
- Relief valve and discharge valve closed
- Check the seal of the unit's valve seat by opening the discharge valve (test using bubble system):
- Slowly rotate the reset lever (See Principle of Operation Schematic) clockwise until the internal bypass is opened. This operation permits the filling of the outlet chamber, the piping downstream and the shutoff valve diaphragm chamber, which can be checked on the gauge positioned downstream
- After the pressure on the gauge has stabilized, continue using the reset lever until it can be connected to the control levers, and at this point, the reset lever will remain stable in its open position.
- After these operations have been performed, the shutoff valve will be ready for service and the downstream valve can be slowly reopened.
- When restoring normal operating conditions, the shutoff valve must always be reset whenever the valve is equipped with the minimum downstream pressure intervention function.

Safety Warning

This product, as of the date of manufacture, is designed and tested to conform to all governmental and industry safety standards as they may apply to the manufacturer. The purchaser/user of this product must comply with all fire control, building codes, and other safety regulations governing the application, installation, operation, and general use of this regulator to avoid leaking gas hazards resulting from improper installation, startup or use of this product.

Itron strongly recommends installation by a qualified professional and periodic inspection of pressure regulators (inspections may be required by local applicable codes or regulations).

Inspections should include checking for gas quality, cycle numbers, external environmental changes, and operating conditions that impact wear on the regulator's moving parts. To ensure safe and efficient operation of this product, replace worn or damaged parts found during inspection.

Limited Warranty

Itron, Inc. 970 Highway 127 North, Owenton, Kentucky 40359-9302, warrants this gas product against defects in materials and workmanship for the earlier of one (1) year from the date the product is shipped by Itron or a period of one year from the date the product is installed by Itron at the original purchaser's site. During such one-year period, provided that the original purchaser continues to own the product, Itron will, at its sole option, repair any defects, replace the product or repay the purchase price.

- > This warranty will be void if the purchaser fails to observe the procedures for installation, operation or service of the product as set forth in the Operating Manual and Specifications for the product or if the defect is caused by tampering, physical abuse or misuse of the product.
- > ITRON SPECIFICALLY DISCLAIMS ALL IMPLIED WARRANTIES INCLUDING THOSE OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE. UNDER NO CIRCUMSTANCES WILL ITRON BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES OF ANY KIND WHATSOEVER.
- > Itron's liability for any claim of any kind, including negligence and breach of warranty for the sale and use of any product covered by or furnished, shall in no case exceed the price allocable to the product or part thereof which gives rise to the claim.

- > In the event of a malfunction of the product, consult your Itron Service Representative or Itron Inc., 970 Highway 127 North, Owenton, Kentucky 40359-9302. See Itron Terms and Conditions of Sale for the full and complete terms of the Limited Warranty.

Ordering Information

Specify:

1. Inlet and Outlet Connection Size and Type
2. Model Number
3. Outlet pressure desired
4. Pilot needed
5. Inlet pressure range
6. Type of gas and maximum capacity required
7. Assembly position number (see chart below)
8. Special requirements such as tagging, 1/8" pipe plug tap, seal wire, etc.

About Itron Inc.

At Itron, we're dedicated to delivering end-to-end smart grid and smart distribution solutions to electric, gas and water utilities around the globe. Our company is the world's leading provider of smart metering, data collection and utility software systems, with nearly 8,000 utilities worldwide relying on our technology to optimize the delivery and use of energy and water. Our offerings include electricity, gas, water and heat meters; network communication technology; collection systems and related software applications; and professional services. To realize your smarter energy and water future, start here: www.itron.com
